

Finite-horizon separation of $V_T(u^*)$ and E_T 

E_T shows near-linear growth on $10^4 \leq T \leq 10^5$ (log--log slope 0.827); E_T/T approaches $c = 0.000169$. Asymptotic $\Theta(T)$ is from Appendix A, not the finite-horizon fit.

 E_T/T stabilizes toward $c > 0$ Two settled regimes, $T = 10^5$
